The Board of Trustees
City of Troy Employees Retirement System
Troy, Michigan

Submitted in this report are the results of the Forty-Fourth Annual Actuarial Valuation of the assets, actuarial values and contribution requirements associated with benefits provided by the City of Troy Employees Retirement System.

The date of the valuation was December 31, 2007.

Valuation results, comments and conclusions are contained in Section A.

The valuation was based upon information, furnished by your Assistant City Manager-Finance Director, concerning Retirement System benefits, financial transactions, and individual members, terminated members, retirants and beneficiaries. Data was checked for year to year consistency, but was not otherwise audited by us. This information is summarized in Section B.

Descriptions of the actuarial cost method and actuarial assumptions are contained in Section C, along with a glossary of technical terms. Governmental Accounting Standards Board (GASB) Statement No. 25 and No. 27 information is contained in Section D.

This report has been prepared by actuaries who have substantial experience valuing public employee retirement systems. To the best of our knowledge, this report is complete and accurate and was made in accordance with standards of practice promulgated by the Actuarial Standards Board of the American Academy of Actuaries. The actuarial assumptions used for the valuation produce results which we believe are reasonable.

Both of the undersigned are members of the American Academy of Actuaries and meet the qualification standards of the American Academy of Actuaries to render the actuarial opinion contained herein.

Respectfully submitted,

Brad Lee Armstrong,
A.S.A., E.A., M.A.A.A.

Randall J. Dziubek
A.S.A., E.A., M.A.A.A.

SECTION A

VALUATION RESULTS, COMMENTS AND CONCLUSIONS

**COMPUTED CITY CONTRIBUTIONS
OF THE RETIREMENT SYSTEM
FOR THE FISCAL YEAR BEGINNING JULY 1, 2008**

1. Actuarial Present Value of All Past and Future Benefits:	
- Active	\$ 69,341,060
- Terminated Vested	\$ 1,078,784
- Retired	<u>\$ 68,494,664</u>
- Total	\$ 138,914,508
2. Funding Value of Assets	\$ 132,916,713
3. Actuarial Present Value of Future Employee Contributions	\$ 2,610,757
4. City's Remaining Unfunded Present Value of Benefits After Recognition of Funding Value of Assets and Future Employee Contributions (1) - (2) - (3)	\$ 3,387,038
5. Present Value Future Salary	\$ 85,515,075
6. Projected Payroll 1/1/2008 - 12/31/2008	\$ 10,440,173
7. City's Annual Normal Cost (4) / (5) * (6) Plus Interest at 6.5% for 6 Months	\$ 426,737
8. Projected Payroll 7/1/2008 - 6/30/2009	\$ 10,408,669
9. City's Annual Normal Cost as a % of Projected Payroll 7/1/2008 - 6/30/2009	4.10%

**COMPUTED CITY PENSION CONTRIBUTIONS

@ After change in asset valuation method.

COMMENTS AND CONCLUSION

COMMENT A: For the plan year ended December 31, 2007, the System generated a \$444,914 experience gain. The gain was primarily the result of investment performance and lower than expected pay increases (partially offset by more retirements and fewer terminations than expected). Overall, the experience gain was approximately 0.3% of beginning of year liabilities. In addition, there are unrecognized investment gains under the asset valuation method illustrated on page B-4 of this report. In particular, the System is positioned to offset some underperformance in investment returns relative to the assumed rate of return of 6.5%. The Board should expect to recognize investment losses and see a corresponding increase in the City's contribution requirement in next year's report if market returns do not exceed 3.0% for the plan year ending December 31, 2008.

COMMENT B: Certain actuarial assumptions and methods were changed since the previous valuation as a result of an Experience Study performed for the years 2001-2006. For a description of the new assumptions and methods see Section C of this report.

CONCLUSION: It is the actuary's opinion that the required contribution rate determined by the most recent actuarial valuation are sufficient to meet the Retirement System's funding objective, presuming continued timely receipt of required contributions.

DERIVATION OF ACTUARIAL GAIN (LOSS)
YEAR ENDED DECEMBER 31, 2007

The actuarial gains or losses realized in the operation of the Retirement System provide an experience test. Gains and losses are expected to cancel each other over a period of years (in the absence of double-digit inflation) and sizable year to year fluctuations are common. Detail on the derivation of the actuarial gain (loss) is shown below, along with a year by year comparative schedule.

(1) UPVFB* at start of year	\$ 2,433,204
(2) Employer and employee contributions	534,330
(3) Estimated reserve transfers	3,037,000
(4) Interest accrual	239,495
(5) Expected UPVFB before changes:	
(1) - (2) + (3) + (4)	5,175,369
(6) Change from revised benefit provisions	0
(7) Change from revised actuarial assumptions	(1,343,417)
(8) Expected UPVFB after changes:	
(5) + (6) + (7)	3,831,952
(9) Actual UPVFB at end of year	3,387,038
(10) Gain (loss): (8) - (9)	\$ 444,914
(11) Gain (loss) as percent of present value of future benefit at start of year	0.3%

* *Unfunded Present Value of Future Benefits. This is the present value of future benefits less the actuarial value of assets.*

Valuation Date December 31	Actuarial Gain (Loss) As % of Beginning UPVFB*
1998	3.8 %
1999	7.0
2000	4.3
2001	3.3
2002	(3.2)
2003	1.6
2004	(3.7)
2005	(0.7)
2006	(0.6)
2007	0.3

* *Prior to 2007 this exhibit shows Actuarial Gain (Loss) as a % of Beginning Actuarial Accrued Liabilities.*

SECTION B

**SUMMARY OF BENEFIT PROVISIONS AND
VALUATION DATA SUBMITTED BY THE
RETIREMENT SYSTEM**

BENEFIT PROVISIONS EVALUATED AND/OR CONSIDERED

(DECEMBER 31, 2007)

REGULAR RETIREMENT (no reduction factor for age):

Eligibility - T.P.O.A., T.F.S.O.A. and T.C.O.A. members: 25 years of service; or age 60 with 10 years of service. General AFSCME, General Clerical Members, Classified or Exempt: Age 50 with 27 years of service; or age 55 with 25 years of service; or age 60 with 10 years of service.

Mandatory Retirement Age - None.

Annual Amount

<u>Division</u>	<u>Benefit</u>	<u>Supplemental Benefit</u>
T.P.O.A.	2.80% * FAC to 25 years 1.00% * FAC 26-30 years	
T.C.O.A.	2.80% * FAC to 25 years 1.00% * FAC 26-30 years	
T.F.S.O.A.	2.25% * FAC * Service	0.25% * FAC * Service
General AFSCME	2.25% * FAC * Service	0.25% * FAC * Service
General Classified/Exempt	2.25% * FAC * Service	0.25% * FAC * Service
General Clerical	2.25% * FAC * Service	0.25% * FAC * Service

Type of Final Average Compensation - Highest 3 years out of last 10. Some lump sums are included but payment of sick or vacation leave is not included.

EARLY RETIREMENT (AGE REDUCTION FACTOR USED):

Eligibility - Age 55 with 10 years of service.

Annual Amount - Computed as regular retirement benefit but reduced by 1/2% for each month by which retirement precedes age 60.

DEFERRED RETIREMENT (vested benefits):

Eligibility - 10 years of service. Benefit payable at age 60.

Annual Amount - Same as regular retirement but based on credited service and final average compensation at termination.

DUTY DISABILITY RETIREMENT:

Eligibility - No age or service requirement. Worker's compensation must be payable.

Annual Amount - Same as regular retirement. Upon termination of worker's compensation the benefit is recomputed to grant service credit for the period in receipt of worker's compensation. Minimum benefit is based on 10 years of credited service (66 2/3% of final average compensation for non-command/exempt public safety members, while in receipt of worker's compensation).

NON-DUTY DISABILITY RETIREMENT:

Eligibility - 5 years of service (10 years for Exempt and Classified, AFSCME employees hired after 2/96.

Annual Amount - Same as regular retirement, but with a minimum benefit based on 10 years of credited service.

DUTY DEATH BEFORE RETIREMENT:

Eligibility - No age or service requirement.

Annual Amount - Widow's benefit equal to regular retirement benefit actuarially reduced in accordance with a 100% joint and survivor election. Minimum benefit is 25% (50% for T.F.S.O.A., Command Officers and T.P.O.A.) of final average compensation. If no widow, children under 18 share equally in 25% (50% for Command Officers and T.P.O.A.) of final average compensation.

NON-DUTY DEATH BEFORE RETIREMENT:

Eligibility - 10 years service.

Annual Amount - Same as regular retirement but reduced in accordance with a 100% joint and survivor election.

AUTOMATIC DEATH BENEFIT AFTER RETIREMENT: NONE.

POST-RETIREMENT ADJUSTMENTS: One-time increases were granted in 1973, 1977, 1978, 1981, 1983, 1989 and 1999.

HEALTH INSURANCE PREMIUM SUBSIDY: Post-retirement health insurance premiums are subsidized by the City as follows:

- T.C.O.A. - Fully paid after 7/1/94.
- T.P.O.A - 4% per complete year, retired after 2/20/1996.
- T.F.S.O.A- 4% per complete year, retired after 1/1/99.
- AFSCME - 4% per complete year, retired after 1/1/01
- Classified Exempt, Clerical - \$400/month or 4% per complete year, whichever is greater.
- Retirees from prior provisions - \$400/month or 3% per complete year, whichever is greater.

MEMBER CONTRIBUTIONS: Expressed as percentages of compensation are as follows:

- 1.5% for clerical members
- 3.0% for T.F.S.O.A.
- 1.5% for classified and Exempt members
- 1.5% for AFSCME
- 4.0% for T.P.O.A.
- 4.0% for T.C.O.A

REPORTED FUND BALANCE (MARKET VALUE)

Reserves	Reported Fund Balance December 31,	
	2007	2006
Reserve for Employees' Contributions	\$ 2,971,629	\$ 2,753,704
Reserve for Employer Contributions	98,211,782	85,141,685
Reserve for Retired Benefit Payments	35,574,522	45,632,241
Reserve for Undistributed Investment Income	0	0
Reserve for Health Insurance Premiums	43,631,352	38,874,516
Total Fund Balance	\$180,389,285	\$172,402,146

Valuation assets are equal to reported market value of assets (excluding health reserves), except that all realized and unrealized gains and losses are spread over a period of years, with 20% recognition the first year. Such spreading reduces the fluctuation in the City's computed contribution rate which might otherwise be caused by market value fluctuations. The details of the spreading technique are shown on page B-4. The valuation assets as of December 31, 2007 total \$132,916,713.

In financing actuarial accrued liabilities, valuation assets of \$132,916,713 were distributed as follows:

Reserves for	Valuation Assets Applied to Actuarial Accrued Liabilities for			Totals
	Active Members	Retirants & Beneficiaries	Contingency Reserve	
Employees' Contributions	\$ 2,971,629			\$ 2,971,629
Employer Contributions	98,211,782			98,211,782
Retired Benefit Payments		\$ 35,574,522		35,574,522
Valuation Asset Adjustment	(3,841,220)			(3,841,220)
Totals	\$ 97,342,191	\$ 35,574,522		\$132,916,713

SECTION C

**FINANCIAL PRINCIPLES, ACTUARIAL VALUATION
PROCESS, ACTUARIAL COST METHODS,
ACTUARIAL ASSUMPTIONS AND DEFINITIONS OF
TECHNICAL TERMS**

BASIC FINANCIAL PRINCIPLES AND OPERATION OF THE RETIREMENT SYSTEM

Benefit Promises Made Which Must Be Paid For. A retirement program is an orderly means of handing out, keeping track of, and financing pension promises to a group of employees. As each member of the retirement program acquires a unit of service credit the member is, in effect, handed an "IOU" which reads: "The City of Troy Employees Retirement System promises to pay you one unit of retirement benefits, payments in cash commencing when you retire."

The principal related financial question is: When shall the money required to cover the "IOU" be contributed? This year, when the benefit of the member's service is received? Or, some future year when the "IOU" becomes a cash demand?

The Constitution of the State of Michigan is directed to the question:

"Financial benefits arising on account of service rendered in each fiscal year shall be funded during that year and such funding shall not be used for financing unfunded accrued liabilities."

This Retirement System meets this requirement by having as its ***financial objective the establishment and receipt of contributions, expressed as percents of active member payroll, which will remain approximately level*** from year to year and will not have to be increased for future generations of taxpayers.

The accumulation of invested assets ***is a by-product of level percent-of-payroll contributions, not the objective.*** Investment income becomes the 3rd major contributor to the retirement program, and the amount is directly related to the amount of contributions and investment performance.

If contributions to the retirement program are less than the preceding amount, the difference, *plus investment earnings not realized thereon*, will have to be contributed at some later time (or benefits will have to be reduced) to satisfy the fundamental fiscal equation under which all retirement programs must operate:

$$B = C + I - E$$

The aggregate amount of **B**enefit payments to any group of members and their beneficiaries cannot exceed the sum of:

The aggregate amount of **C**ontributions received on behalf of the group

... plus ...

Investment earnings on contributions received and not required for immediate cash payments of benefits

... minus ...

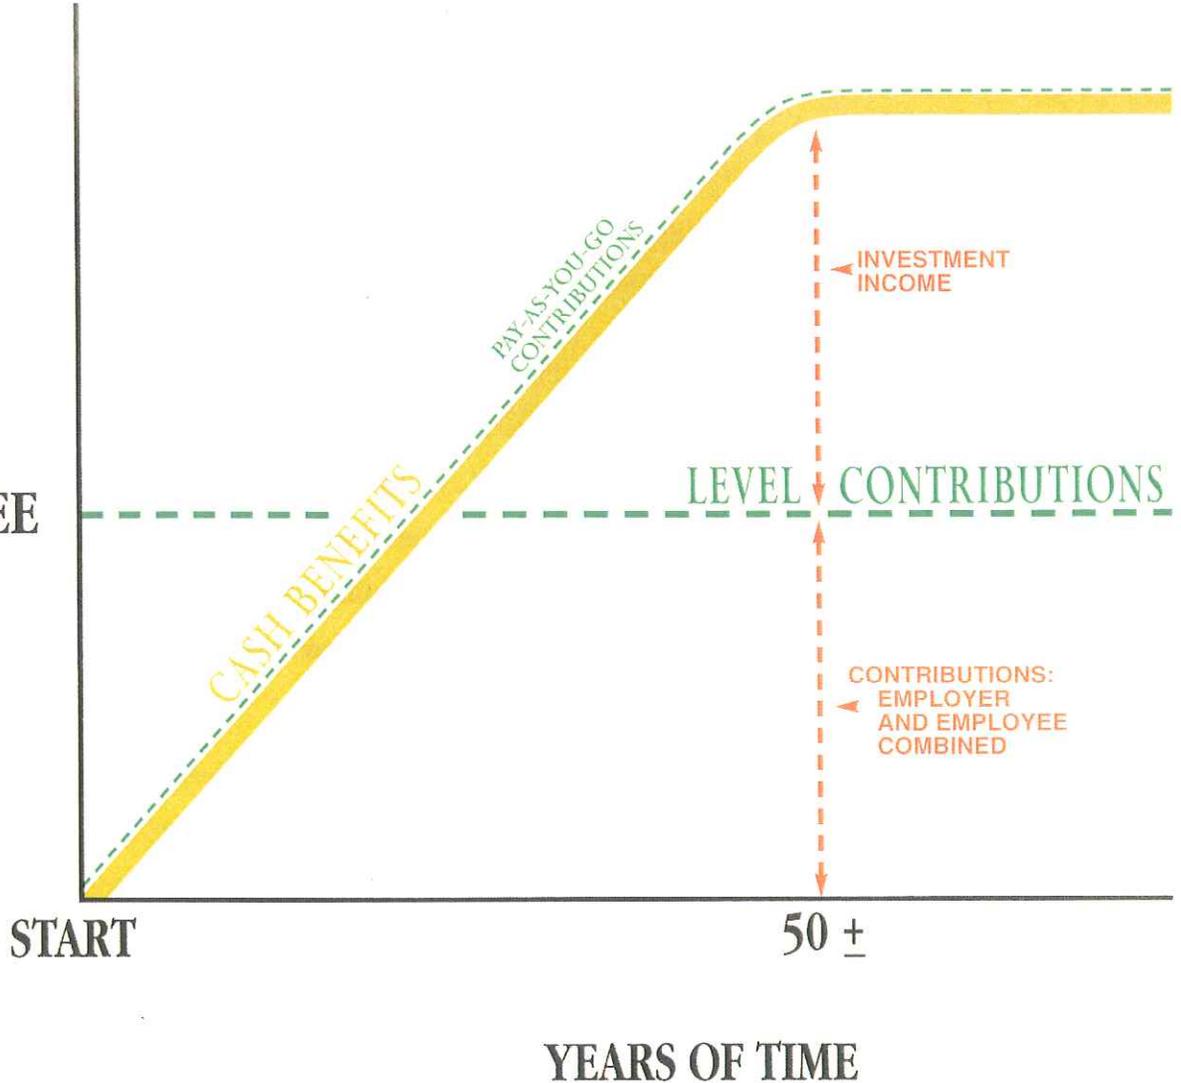

The **E**xpenses of operating the program.

There are retirement programs designed to defer the bulk of contributions far into the future. The present contribution rate for such systems is *artificially low*. The fact that the contribution rate is destined to increase relentlessly to a much higher level is often ignored.

This method of financing is prohibited in Michigan by the state constitution.

Computed Contribution Rate Needed to Finance Benefits. From a given schedule of benefits and from the data furnished, the actuary calculates the contribution rate *by means of an actuarial valuation* - the technique of assigning monetary values to the risks assumed in operating a retirement program.

**% OF
ACTIVE
EMPLOYEE
PAYS**

CASH BENEFITS LINE. This relentlessly increasing line is the fundamental reality of retirement plan financing. It happens each time a new benefit is added for future retirements (and happens regardless of the design for contributing for benefits).

LEVEL CONTRIBUTION LINE. Determining the level contribution line requires detailed assumptions concerning a variety of experiences in future decades, including:

Economic Risk Areas

- Rates of investment return
- Rates of pay increase
- Changes in active member group size

Non-Economic Risk Areas

- Ages at actual retirement
- Rates of mortality
- Rates of withdrawal of active members (turnover)
- Rates of disability

THE ACTUARIAL VALUATION PROCESS

The *financing diagram* on the previous page shows the relationship between the two fundamentally different philosophies of paying for retirement benefits: the method where contributions match cash benefit payments (or barely exceed cash benefit payments, as in the Federal Social Security program) which is an *increasing contribution method*; and the *level contribution method* which equalizes contributions between the generations.

The *actuarial valuation* is the mathematical process by which the level contribution rate is determined, and the flow of activity constituting the valuation may be summarized as follows:

- A. ***Covered Person Data***, furnished by plan administrator.
 - Retired lives now receiving benefits
 - Former employees with vested benefits not yet payable
 - Active employees

- B. + ***Asset data*** (cash & investments), furnished by plan administrator

- C. + ***Assumptions concerning future financial experience in various risk areas***, which assumptions are established by the Board of Trustees after consulting with the actuary

- D. + The ***funding method*** for employer contributions (the long-term, planned pattern for employer contributions)

- E. + ***Mathematically combining the assumptions, the funding method, and the data***

- F. = Determination of:
 - Plan financial position

 - and/or New Employer Contribution Rate

ACTUARIAL COST METHODS USED FOR THE VALUATION

The funding method used in this actuarial valuation is the *Aggregate Cost Method*. Under this method the Actuarial Present Value of Projected Benefits of the group included in the valuation, less the sum of the Funding Value of Assets and the Actuarial Present Value of Future Member Contributions is allocated over a future scheduled period. This allocation is performed for the group as a whole, not as a sum of individual allocations. The portion of this Actuarial Present Value allocated to a specific year is called the City's Annual Normal Cost. Under this method, actuarial gains (losses) reduce (increase) future Normal Costs.

ACTUARIAL ASSUMPTIONS IN THE VALUATION PROCESS

The actuary calculates contribution requirements and actuarial present values of a retirement system by applying actuarial assumptions to the benefit provisions and people information of the system, using the actuarial cost methods described on page C-5.

The principal areas of risk which require assumptions about future experience are:

- (i) Long-term rates of investment return to be generated by the assets of the System.
- (ii) Patterns of pay increases to members.
- (iii) Rates of mortality among members, retirants and beneficiaries.
- (iv) Rates of withdrawal of active members.
- (v) Rates of disability among active members.
- (vi) The age patterns of actual retirements.

In making a valuation, the actuary calculates the monetary effect of each assumption for as long as a present covered person survives - - - a period of time which can be as long as a century.

The employer contribution rate has been computed to remain level from year to year so long as benefits and the basic experience and make-up of members do not change. Examples of favorable experience which would tend to reduce the employer contribution rate are:

- (1) Investment returns in excess of 6.5% per year.
- (2) Member non-vested terminations at a higher rate than outlined on page C-11.
- (3) Mortality among retirants and beneficiaries at a higher rate than indicated by the RP-2000 Combined Healthy Mortality Table.

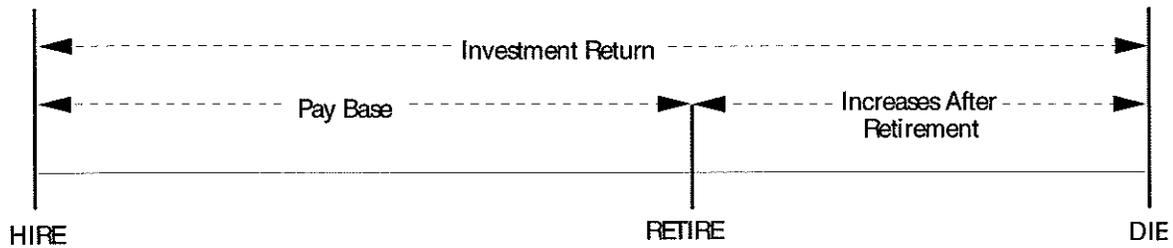

Examples of unfavorable experience which would tend to increase the employer contribution rate are:

- (1) Pay increases in excess of the rates outlined on page C-9.
 - (2) An acceleration in the rate of retirement from the rates outlined on page C-12.
-

Actual experience of the system will not coincide exactly with assumed experience, regardless of the choice of the assumptions, the skill of the actuary or the precision of the calculations. Each valuation provides a complete recalculation of assumed future experience and takes into account all past differences between assumed and actual experience. The result is a continual series of adjustments (usually small) to the computed contribution rate.

From time to time one or more of the assumptions is modified to reflect experience trends (but not random or temporary year to year fluctuations).

RELATIONSHIP OF ECONOMIC ASSUMPTIONS IN COMPUTING CONTRIBUTIONS TO A RETIREMENT SYSTEM

Investment Return

An increase in this assumption reduces computed contributions. The assumption operates over all parts of an employee's lifetime.

Pay Base

An increase in this assumption increases computed contributions. However, a 1% increase in this assumption, coupled with a 1% increase in Investment Return reduces computed contributions. This is because the Pay Base assumption operates only over an employee's working lifetime, while the Investment Return assumption operates over the employee's entire lifetime, and therefore has a greater effect.

Increases After Retirement

An increase in this element increases computed contributions.

If Investment Return, Pay Base, and Increases After Retirement are each increased by equal amounts, computed contributions remain the same (except in plans using Final Average Pay as a factor in computing benefits; the multi-year average used for Final Average Pay causes computed contributions to decrease slightly).

If Investment Return and Pay Base are increased by equal amounts, with no change in Increases After Retirement, computed contributions decrease – sometimes significantly. The decreases represent the projected devaluation of an employee's benefits following retirement.

ACTUARIAL ASSUMPTIONS USED FOR THE VALUATION

Investment Return (net of expenses).

6.5% per year, compounded annually. This rate consists of a real rate of return of 3.0% per year plus a long-term rate of wage inflation of 3.5% per year.

This assumption is used to equate the value of payments due at different points in time and was first used for the December 31, 1995 valuation. The 3.5% wage inflation assumption was first used for the December 31, 2007 valuation. Approximate rates of investment return, for the purpose of comparisons with assumed rates, are shown below:

	Year Ended December 31				
	2007	2006	2005	2004	2003
Recognized Rate of Investment Return	7.2%	6.7%	4.8%	5.0%	9.7%

The nominal rate of return was computed using the approximate formula $i = I$ divided by $1/2 (A + B - I)$, where I is actual investment income (after smoothing gains and losses) net of expenses, A is the beginning of year valuation asset value, and B is the end of year valuation asset value.

These rates of return should not be used for measurement of an investment advisor's performance or for comparisons with other systems -- *to do so will mislead*.

Pay Projections. These assumptions are used to project current pays to those upon which benefits will be based. The assumptions were first used for the December 31, 2007 valuation.

Annual Rate of Pay Increase for Sample Ages			
Sample Ages	Base (Economic)	Merit and Longevity	Total
20	3.5 %	4.0 %	7.5 %
25	3.5	3.2	6.7
30	3.5	2.8	6.3
35	3.5	2.5	6.0
40	3.5	2.2	5.7
45	3.5	1.7	5.2
50	3.5	1.2	4.7
55	3.5	0.7	4.2
60	3.5	0.2	3.7

Changes actually experienced in average pay have been as follows:

Increase in	Year Ended December 31					3-Year Average	5-Year Average
	2007	2006	2005	2004	2003		
Average pay	5.5%	2.5%	2.9%	6.2%	1.9%	3.6%	3.8%

Mortality Table. The RP-2000 Combined Healthy Mortality Table, for males and females. This table was first used for the December 31, 2007 valuation. Sample values follow:

Sample Attained Ages	Single Life Retirement Values			
	Present Value of \$1.00 Monthly for Life		Future Life Expectancy (Years)	
	Men	Women	Men	Women
50	\$156.42	\$161.11	30.80	33.59
55	146.11	152.04	26.18	28.91
60	133.49	140.76	21.74	24.38
65	118.85	127.55	17.61	20.12
70	102.73	112.76	13.88	16.23
75	85.47	96.73	10.57	12.74
80	68.04	79.91	7.75	9.68

This assumption is used to measure the probabilities of members dying before retirement and the probabilities of each benefit payment being made after retirement.

Rates of separation from active membership. The rates do not apply to members eligible to retire and do not include separation on account of death or disability. This assumption measures the probabilities of members remaining in employment.

Sample Ages	Years of Service	Percent Separating Within Next Year	
		General	Public Safety
ALL	0	30.00 %	15.00 %
	1	20.00	10.00
	2	15.00	8.00
	3	10.00	7.00
	4	7.00	6.00
25	5 & Over	6.00	5.00
30		6.00	4.50
35		6.00	3.55
40		6.00	1.45
45		3.50	0.75
50		1.50	0.75
55		1.50	0.75
60		1.50	0.75

The rates were first used for the December 31, 1975 valuation.

Rates of Disability. These assumptions represent the probabilities of active members becoming disabled.

Sample Ages	Percent Becoming Disabled Within Next Year	
	Men	Women
20	0.08 %	0.10 %
25	0.08	0.10
30	0.08	0.10
35	0.08	0.10
40	0.20	0.36
45	0.26	0.41
50	0.49	0.57
55	0.89	0.77
60	1.41	1.02
65	1.66	1.23

These rates were first used for the December 31, 1976 valuation.

Rates of Retirement. These rates are used to measure the probabilities of an eligible member retiring during the next year.

Retirement Ages	Percent of Active Members Retiring Within Next Year			
	General	Public Safety		
		T.F.S.O.A. & Exempt	T.C.O.A.	T.P.O.A.

60	5	100		
61	5			
62	30			
63	10			
64	10			
65	100			

T.P.O.A, T.F.S.O.A. and T.C.O.A. members were assumed to be eligible for retirement after 25 years of service, or after attaining age 60 with 10 or more years of service. Members were assumed to be eligible for retirement after attaining age 50 with 27 years of service, or after attaining age 60 with 10 or more years of service. General AFSCME, General Clerical, and Classified or Exempt members were assumed to be eligible for retirement after attaining age 50 with 27 years of service, or age 55 with 25 years of service; or age 60 with 10 years of service.

These rates were first used for the December 31, 1973 valuation. The rates for Classified, Exempt and Command Officers were first used for the December 31, 1981 valuation. The rates for Non-Classified/Exempt General members were first used for the December 31, 1986 valuation.

**SUMMARY OF ASSUMPTIONS USED
DECEMBER 31, 2007**

Pensions in an Inflationary Environment

**VALUE OF \$1,000/MONTH RETIREMENT BENEFIT
To an Individual Who Retires at Age 60
In an Environment of 3.50% Inflation**

<u>Age</u>	<u>Value</u>
60	\$1,000
61	966
62	933
63	901
64	871
65	842
70	708
75	596
80	502
85	423

The life expectancy of a 60 year old male retiree is age 82. The life expectancy for a 60 year old female retiree is age 84. Half of the people will outlive their life expectancy. The effects of even moderate amounts of inflation can be significant for those who live to an advanced age.

**SUMMARY OF ASSUMPTIONS USED
MISCELLANEOUS AND TECHNICAL ASSUMPTIONS
DECEMBER 31, 2007**

Marriage Assumption. 90% of males and 90% of females are assumed to be married for purposes of death-in-service benefits.

Pay Increase Timing. Beginning of (Fiscal) year. This is equivalent to assuming that reported pays represent amounts paid to members during the year ended on the valuation date.

Decrement Timing. Decrements of all types are assumed to occur mid-year.

Eligibility Testing. Eligibility for benefits is determined based upon the age nearest birthday and service nearest whole year on the date the decrement is assumed to occur.

Benefit Service. Exact fractional service is used to determine the amount of benefit payable.

Decrement Relativity. Decrement rates are used without adjustment for multiple decrement table effects.

Decrement Operation. Disability and mortality decrements do not operate during the first 5 years of service. Disability and withdrawal do not operate during retirement eligibility.

Normal Form of Benefit. The assumed normal form of benefit is the straight life form.

Incidence of Contributions. Contributions are assumed to be received continuously throughout the year based upon the computed percent of payroll shown in this report, and the actual payroll payable at the time contributions are made.

DEFINITIONS OF TECHNICAL TERMS

Accrued Service. Service credited under the system which was rendered before the date of the actuarial valuation.

Actuarial Accrued Liability. The difference between the actuarial present value of system benefits and the actuarial present value of future normal costs. Also referred to as "past service liability".

Actuarial Assumptions. Estimates of future experience with respect to rates of mortality, disability, turnover, retirement, rate or rates of investment income and salary increases. Decrement assumptions (rates of mortality, disability, turnover and retirement) are generally based on past experience, often modified for projected changes in conditions. Economic assumptions (salary increases and investment income) consist of an underlying rate in an inflation-free environment plus a provision for a long-term average rate of inflation.

Actuarial Cost Method. A mathematical budgeting procedure for allocating the dollar amount of the "actuarial present value of future benefits" between future normal costs and actuarial accrued liability. Sometimes referred to as the "actuarial funding method".

Actuarial Equivalent. One series of payments is said to be actuarially equivalent to another series of payments if the two series have the same actuarial present value.

Actuarial Gain (Loss). The difference between actual unfunded actuarial accrued liabilities and anticipated unfunded actuarial accrued liabilities -- during the period between two valuation dates. It is a measurement of the difference between actual and expected experience.

Actuarial Present Value. The amount of funds currently required to provide a payment or series of payments in the future. It is determined by discounting future payments at predetermined rates of interest, and by probabilities of payments.

Amortization. Paying off an interest-discounted amount with periodic payments of interest and (generally) principal -- as opposed to paying off with a lump sum payment.

Aggregate Cost Method is a method where the Actuarial Present Value of Projected Benefits of the group included in the valuation, less the sum of the Funding Value of Assets and the Actuarial Present Value of Future Member Contributions is allocated over a future scheduled period. This allocation is performed for the group as a whole, not as a sum of individual allocations. The portion of this Actuarial Present Value allocated to a specific year is called the City's Annual Normal Cost. Under this method, actuarial gains (losses) reduce (increase) future Normal Costs.

Credited Projected Benefit. The portion of a member's projected benefit attributable to service before the valuation date - allocated based on the ratio of accrued service to projected total service and based on anticipated future compensation.

Experience Gain (loss). The difference between actual actuarial costs and assumed actuarial costs – during the period between two valuation dates.

Funding Value of Assets. Also referred to as actuarial value of assets, smoothed market value of assets, or valuation assets.

Valuation assets recognize assumed investment return fully each year. Differences between actual and assumed investment return are phased in over a closed 5 year period. During periods when investment performance exceeds the assumed rate, valuation assets will tend to be less than market value. During periods when investment performance is less than the assumed rate, valuation assets will tend to be greater than market value. If assumed rates are exactly realized for 4 consecutive years, valuation assets will become equal to market value.

Normal Cost. The portion of the actuarial present value of future benefits that is assigned to the current year by the actuarial cost method. Sometimes referred to as "current service cost".

Unfunded Actuarial Accrued Liabilities. The difference between actuarial accrued liabilities and valuation assets. Sometimes referred to as "unfunded past service liability" or "unfunded supplemental present value".

Most retirement systems have unfunded actuarial accrued liabilities. They arise each time new benefits are added and each time an actuarial loss occurs.

The existence of unfunded actuarial accrued liabilities is not in itself bad, any more than a mortgage on a house is bad. Unfunded actuarial accrued liabilities do not represent a debt that is payable today. What is important is the ability to amortize the unfunded actuarial accrued liabilities and the trend in their amount (after due allowance for devaluation of the dollar).

SECTION D

CERTAIN DISCLOSURES REQUIRED BY STATEMENTS NO. 25 AND NO. 27 OF THE GOVERNMENTAL ACCOUNTING STANDARDS BOARD

This information is presented in draft form for review by the City's auditor. Please let us know if there are any items that the auditor changes so that we may maintain consistency with the City's financial statements.

ACTUARIAL ACCRUED LIABILITY

The actuarial accrued liability is a measure intended to help users assess (i) a pension fund's funded status on a going concern basis, and (ii) progress being made toward accumulating the assets needed to pay benefits as due. The excess of the Actuarial Present Value of Projected Benefits of the group included in an Actuarial Valuation over the Actuarial Value of Assets is allocated **on a level basis over the payroll of the group between the valuation date and assumed exit**. This allocation is performed for the group as a whole, not as a sum of individual allocations. That portion of the Actuarial Present Value allocated to a valuation year is called the Normal Cost. The Actuarial Accrued Liability is equal to the Actuarial Value of Assets. Under this method, the Actuarial Gains (Losses), as they occur, reduce (increase) future Normal Costs.

The preceding methods comply with the financial reporting standards established by the Governmental Accounting Standards Board.

The Present Value of Projected Benefits was determined as part of an actuarial valuation of the plan as of December 31, 2007. Significant actuarial assumptions used in determining the Present Value of Projected Benefits include (a) a rate of return on the investment of present and future assets of 6.5% per year compounded annually, (b) projected salary increases of 3.5% per year compounded annually, (c) additional projected salary increases of 0.0% to 4.0% per year attributable to seniority/merit, and (d) the assumption that benefits will not increase after retirement.

Actuarial Present Value of All Past and Future Benefits	
Active members	\$ 69,341,060
Retired members and beneficiaries currently receiving benefits	68,494,664
Vested terminated members not yet receiving benefits	1,078,784
Total	138,914,508
Actuarial Value of Assets (market value was \$136,757,933)	132,916,713
Present Value of Future Employee Contributions	2,610,757
Unfunded Present Value of Future Benefits	\$ 3,387,038

During the year ended December 31, 2007, the Plan experienced a net change of \$1,469,232 in the actuarial present value of projected benefits. Changes in actuarial assumptions accounted for (\$1,343,417) of this change. There were no changes in benefits during the year.
